

DTT 2019

## Chemistry HSC Year 11

### Suggested Solutions and Marking Scheme

#### Test 1: Module 1 (Properties and Structure of Matter)

- Properties of Matter
- Atomic Structure and Atomic Mass

TOTAL 25 MARKS (45 MINUTES)

#### PART A

Answer and explanation	Syllabus outcomes and targeted performance bands
<b>Question 1</b> <b>A</b> Compounds with names ending in 'ide' usually contain two elements. This reflects IUPAC nomenclature rules.	CH11-4                      Band 2
<b>Question 2</b> <b>D</b> An atom is not a subatomic particle. Protons and neutrons have a mass of approximately 1.0 atomic mass units (amu) and electrons have a mass of approximately 0.0055 amu.	CH11-4                      Band 2
<b>Question 3</b> <b>C</b> Metals are found on the left-hand side and centre of the Periodic Table. Non-metals are found on the right. Semi-metals (metalloids) are found along the stepped division between metals and non-metals.	CH11-8                      Band 3
<b>Question 4</b> <b>C</b> $\text{R.A.M.} = \frac{(\text{mass of isotope A} \times \%) + (\text{mass of isotope B} \times \%)}{100}$ $= \frac{(35 \times 76) + (37 \times 24)}{100}$ $= 35.5 \text{ amu}$	CH11-4                      Band 4
<b>Question 5</b> <b>B</b> This isotope has an atomic number of 79 and mass number of 197. Hence it has 79 electrons, 79 protons, 118 (197-79) neutrons and 197 nucleons (protons plus neutrons).	CH11-8                      Band 3

**PART B – 20 MARKS**

Sample answer	Syllabus outcomes, targeted performance bands and marking guide
<p><b>Question 6</b></p> <p><b>a.</b> A homogeneous mixture is any mixture that is uniform in composition throughout; the separate components cannot be observed. The mixture is all in the same phase (state). Examples include sea water (salts dissolved evenly throughout the mixture) and the atmosphere (nitrogen, oxygen and other gases mixed evenly).</p> <p>A heterogeneous mixture has a composition that varies from one region to another, with at least two phases that remain separate from each other. If a heterogeneous mixture is studied, the separate components can be seen. Examples include concrete (stones, cement and water) and ice cubes in cola.</p>	<p>CH11-8 Bands 2-3</p> <ul style="list-style-type: none"> <li>Outlines the difference between homogeneous and heterogeneous mixtures.</li> </ul> <p>AND</p> <ul style="list-style-type: none"> <li>Gives a valid example of both mixtures. 2</li> </ul> <hr/> <ul style="list-style-type: none"> <li>Outlines the difference between homogeneous and heterogeneous mixtures. 1</li> </ul>
<p><b>b.</b></p> <ul style="list-style-type: none"> <li>I filter paper</li> <li>II filter funnel</li> <li>III evaporating basin</li> <li>IV filtrate</li> <li>V residue</li> </ul>	<p>CH11-2 Bands 3-4</p> <ul style="list-style-type: none"> <li>Identifies all FIVE parts. 2</li> </ul> <hr/> <ul style="list-style-type: none"> <li>Identifies at least TWO parts. 1</li> </ul>
<p><b>Question 7</b></p> <p><b>a.</b> calcium fluoride</p>	<p>CH11-2 Band 2</p> <ul style="list-style-type: none"> <li>Correctly identifies compound. 1</li> </ul>
<p><b>b.</b> <math>\frac{19.3}{68.1} \times 100 = 28.3</math></p>	<p>CH11-4 Bands 3-4</p> <ul style="list-style-type: none"> <li>Correctly calculates percentage AND shows working. 1</li> </ul>
<p><b>c.</b> flame test</p>	<p>CH11-3 Band 2</p> <ul style="list-style-type: none"> <li>Correctly identifies test. 1</li> </ul>

**PART B – 20 MARKS****ATTEMPT QUESTIONS 6–10****ANSWER THE QUESTIONS IN THE SPACES PROVIDED****Question 6** (4 marks)

The following table contains data on the radii of atoms of Group 1 elements.

Element	Atomic radius ( $\times 10^{-12}$ m)
lithium	130
sodium	160
potassium	203
rubidium	216
caesium	235

- a. Describe and explain the trend in atomic radii for these elements. 2 marks

---

---

---

---

- b. Outline the trends of another physical property going down the elements in Group 1 or another named group. 2 marks

---

---

---

---

**PART B – 20 MARKS**

Sample answer	Syllabus outcomes, targeted performance bands and marking guide
<p><b>Question 6</b></p> <p>a. The atomic radii increase as we go down the group. This is because extra electron shells/energy levels are being added to hold the ‘extra’ electrons and this increases the size.</p>	<p>CH11–8 Bands 3–4</p> <ul style="list-style-type: none"> <li>Describes the trend of atomic radii.</li> </ul> <p>AND</p> <ul style="list-style-type: none"> <li>Explains TWO points. 2</li> </ul> <hr/> <ul style="list-style-type: none"> <li>Describes the trend of atomic radii.</li> </ul> <p>AND</p> <ul style="list-style-type: none"> <li>Explains ONE point. 1</li> </ul>
<p>b. <i>For example:</i> Melting point: In Group 1, melting points decrease going down the group.</p>	<p>CH11–8 Bands 3–4</p> <ul style="list-style-type: none"> <li>Names an appropriate trend for a particular group.</li> </ul> <p>AND</p> <ul style="list-style-type: none"> <li>Correctly describes the trend. 2</li> </ul> <hr/> <ul style="list-style-type: none"> <li>Provides some relevant information. 1</li> </ul>
<p><b>Question 7</b></p> <p>The student has confused periods with groups. Allowing for that, some principles have been identified but other points could be made. The answer could include:</p> <ul style="list-style-type: none"> <li>The first shell has a maximum of two electrons.</li> <li>The outer shell has a maximum of eight electrons.</li> <li>Inner shells can have more than eight electrons.</li> <li>Transition metals have incomplete inner shells.</li> </ul> <p>There is no mention of energy levels.</p>	<p>CH11–8 Bands 4–6</p> <ul style="list-style-type: none"> <li>Gives a clear discussion stating at least THREE relevant points. 3</li> </ul> <hr/> <ul style="list-style-type: none"> <li>Gives a clear discussion stating at least TWO relevant points. 2</li> </ul> <hr/> <ul style="list-style-type: none"> <li>Provides some relevant information. 1</li> </ul>

**PART B** (continued)

Sample answer	Syllabus outcomes, targeted performance bands and marking guide
<p><b>c.</b> Use the formula: <math>C_1V_1 = C_2V_2</math></p> $C_2 = \frac{C_1V_1}{V_2}$ <p>Where:</p> <p><math>C_1</math> = initial concentration <math>\rightarrow 0.2 \text{ mol L}^{-1}</math></p> <p><math>V_1</math> = initial volume <math>\rightarrow \frac{50}{1000} = 0.05 \text{ L}</math></p> <p><math>C_2</math> = new concentration <math>\rightarrow</math> unknown</p> <p><math>V_2</math> = new volume <math>\rightarrow \frac{250}{1000} = 0.0250 \text{ L}</math></p> $C_2 = \frac{0.2 \times 0.05}{0.25} = 0.04 \text{ mol L}^{-1}$ <p><i>Note: The student could also use the information that the dilution was five-fold.</i></p>	<p>CH11–6, 9 Bands 3–4</p> <ul style="list-style-type: none"> <li>Shows appropriate calculations.</li> </ul> <p>AND</p> <ul style="list-style-type: none"> <li>Provides correct concentration. 1</li> </ul>
<p><b>Question 8</b></p> <p><b>a.</b> An excess of silver nitrate was added to ensure that all of the magnesium chloride was reacted.</p>	<p>CH11–9 Bands 2–3</p> <ul style="list-style-type: none"> <li>Gives an appropriate reason. 1</li> </ul>
<p><b>b.</b> The stoichiometry of the reaction shows that two moles of the precipitate (silver chloride) are formed for every one mol of magnesium chloride present, a ratio of 2 : 1.</p> <p>molar mass (<i>MM</i>) of silver chloride</p> $= (1 \times 107.9) + (1 \times 35.45)$ $= 143.4 \text{ g}$ <p>number of mol of magnesium chloride = <math>n</math></p> $= cV$ $= 0.1 \times \frac{50}{1000}$ $= 0.005$ <p>number of mol of silver chloride = <math>0.005 \times 2</math></p> $= 0.010$ <p>mass = <math>m</math></p> $= n \times MM$ $= 0.010 \times 143.4$ $= 1.43 \text{ g (to three significant figures)}$	<p>CH11–9 Bands 4–5</p> <ul style="list-style-type: none"> <li>Uses appropriate equations.</li> </ul> <p>AND</p> <ul style="list-style-type: none"> <li>Calculates mass accurately. 2</li> </ul> <hr/> <ul style="list-style-type: none"> <li>Uses appropriate equations. 1</li> </ul>

<p><b>Question 9</b></p> <p><b>a.</b> <math>\text{Cu}(s) + 4\text{HNO}_3(aq) \rightarrow</math>  <math>\text{Cu}(\text{NO}_3)_2(aq) + 2\text{NO}_2(g) + 2\text{H}_2\text{O}(l)</math></p> <p>Stoichiometry shows two mol of gas are generated for every mol of copper.</p> $\text{number of mol of copper, } n = \frac{m}{MM}$ $= \frac{5.63}{63.5}$ $= 0.08866$ <p>volume of gas = <math>n \times</math> molar volume  <math>= 0.1773 \times 24.79</math>  <math>= 4.40 \text{ L (to three significant figures)}</math></p> <p><i>Note: Current NESAs data sheet gives 24.79 L as the molar volume under these conditions.</i></p>	<p>CH11-9 Bands 5-6</p> <ul style="list-style-type: none"> <li>Uses appropriate formula.</li> </ul> <p>AND</p> <ul style="list-style-type: none"> <li>Calculates volume accurately. 2</li> </ul> <hr/> <ul style="list-style-type: none"> <li>Uses appropriate formula. 1</li> </ul>
<p><b>b.</b> <math>PV = nRT</math></p> $V = \frac{nRT}{P}$ $= \frac{0.1773 \times 8.314 \times 293.15}{101.3}$ $= 4.27 \text{ L (to three significant figures)}$	<p>CH11-9 Bands 2-3</p> <ul style="list-style-type: none"> <li>Uses appropriate equation.</li> </ul> <p>AND</p> <ul style="list-style-type: none"> <li>Calculates new volume accurately. 1</li> </ul>

**Question 2**

Solid ammonium thiocyanate reacts spontaneously with solid barium hydroxide according to the equation shown below.

The mixture becomes much colder as the reaction proceeds.

Which one of the following is accurate when the solution has returned to its initial temperature?

- A. The energy stored in the reactants was greater than the energy stored in the products.
- B. The energy stored in the products is greater than the energy that was stored in the reactants.
- C. There is no difference between the energy stored in the reactants and the products.
- D. The total amount of stored energy in the mixture has decreased.

**Question 3**

A student measures 200 mL of water into a thermally insulated container and records the temperature of the water as 22.0°C. The student adds 0.10 mol  $\text{NH}_4\text{NO}_3(s)$  to the water and stirs the solution until the solid has dissolved. This process is represented by the equation shown below.

Given the above information, how will the temperature change?

- A. The temperature will rise by 3.04°C.
- B. The temperature will fall until the water turns to ice.
- C. The temperature will rise to 52.0°C.
- D. The temperature will fall to a minimum of 19.0°C.

**Question 4**

Consider the chemical reaction shown below.

Given the above information, which one of the following conclusions is correct?

- A. The enthalpy of formation ( $\Delta H_f^0$ ) for  $\text{HBr}(l)$  is  $107.4 \text{ kJ mol}^{-1}$ .
- B. The enthalpy of formation of  $\text{HBr}(g)$  would be greater than  $107.4 \text{ kJ mol}^{-1}$ .
- C. The enthalpy of formation ( $\Delta H_f^0$ ) for  $\text{HBr}(l)$  is  $-53.7 \text{ kJ mol}^{-1}$ .
- D. H–H bonds and Br–Br bonds are both stronger than H–Br bonds.

**Question 5**

Solid vanadium pentoxide ( $\text{V}_2\text{O}_5$ ) is employed industrially in the oxidation of sulfur dioxide to sulfur trioxide at 440°C according to the equation shown below.

Without the use of a catalyst, how would the reaction differ?

- A. The number of molecules with sufficient energy to react would decrease.
- B.  $\Delta H$  for the reaction would become positive.
- C.  $\Delta H$  for the reaction would be much less.
- D. The reactants would form different products.

- d. Explain the difference between these values in terms of bonding and thermodynamic quantities.

2 marks

---

---

---

---

**Question 9** (4 marks)

A research scientist has proposed an environmentally safe method of storing solar energy for consumption at night. Electrical current from solar panels is used to convert liquid water at 25.0°C to hydrogen gas and oxygen gas. The oxygen gas is released into the atmosphere and the hydrogen gas is stored under pressure. At night, the hydrogen gas is burned with atmospheric oxygen to produce steam. The steam is used to turn electrical generators.

- a. Calculate the amount of electrical energy required to convert 10.0 kg of liquid water to its gaseous elements using standard enthalpies of formation.

1 mark

---

---

---

---

- b. Evaluate the scientist's proposal in terms of your understanding of thermodynamics.

3 marks

---

**PART B** (continued)

Sample answer	Syllabus outcomes, targeted performance bands and marking guide
<b>Question 8</b> <b>a.</b> $\text{CH}_3\text{CH}_2\text{OH}(l) + 3\text{O}_2(g) \rightarrow 2\text{CO}_2(g) + 3\text{H}_2\text{O}(g)$	CH11/12–6, 7 <span style="float: right;">Band 2</span> <ul style="list-style-type: none"> <li>• Provides the correct equation, including all states. <span style="float: right;">1</span></li> </ul>
<b>b.</b> The bonds broken are: 1 mol C–C = $1 \times 346 = 346$ kJ 5 mol C–H = $5 \times 414 = 2070$ kJ 1 mol C–O = $1 \times 352 = 352$ kJ 1 mol O–H = $1 \times 465 = 465$ kJ 3 mol O=O = $3 \times 498 = 1494$ kJ Total energy required = 4727 kJ  The bonds formed are: 4 moles C=O = $4 \times 804 = 3216$ kJ 6 moles O–H = $6 \times 465 = 2790$ kJ Total energy given out = 6006 kJ  The energy given out by new bonds forming is greater than the energy required to break the existing bonds, so the overall process is exothermic and $\Delta H$ is negative. $\Delta H = -(6006 - 4727) = -1279 \text{ kJ mol}^{-1}$	CH11/12–6, 7 <span style="float: right;">Band 4</span> <ul style="list-style-type: none"> <li>• Correctly calculates the total bond breaking energy required.</li> </ul> AND <ul style="list-style-type: none"> <li>• Correctly calculates the total bond forming energy given out.</li> </ul> AND <ul style="list-style-type: none"> <li>• Derives the value of <math>\Delta H_c</math> with the correct sign. <span style="float: right;">2</span></li> </ul> <hr/> <ul style="list-style-type: none"> <li>• Derives the value of <math>\Delta H_c</math> with the incorrect sign. <span style="float: right;">1</span></li> </ul>
<b>c.</b> $\Delta H = \Sigma \Delta H_f^0(\text{products}) - \Sigma \Delta H_f^0(\text{reactants})$ $\Delta H = (2 \times -393.5 + 3 \times -241.8) - (-277.7)$ $= -1235 \text{ kJ mol}^{-1}$	CH11/12–6, 7 <span style="float: right;">Band 3</span> <ul style="list-style-type: none"> <li>• Provides the correct calculation. <span style="float: right;">1</span></li> </ul>

**PART B** (continued)

Sample answer	Syllabus outcomes, targeted performance bands and marking guide
<p><b>d.</b> The bond enthalpy calculation takes no consideration of the intermolecular bonds that must be broken in order to convert liquid ethanol to gaseous ethanol. These would be primarily hydrogen bonds with a small contribution of Van de Waals intermolecular bonding. The difference is due to the enthalpy of vaporisation of ethanol.</p> <p><i>Note: The bond enthalpy calculation is for the process given below.</i></p> $\text{CH}_3\text{CH}_2\text{OH}(g) + 3\text{O}_2(g) \rightarrow 2\text{CO}_2(g) + 3\text{H}_2\text{O}(g)$ $\Delta H = -1235 \text{ kJ mol}^{-1}$ <p>The second calculation involving enthalpies of formation is for the combustion of liquid ethanol. Using Hess's law, we can write the whole process as the sum of two, as shown below.</p> $\text{CH}_3\text{CH}_2\text{OH}(l) + 3\text{O}_2(g) \rightarrow 2\text{CO}_2(g) + 3\text{H}_2\text{O}(g)$ $\Delta H = -1235 \text{ kJ mol}^{-1}$ $2\text{CO}_2(g) + 3\text{H}_2\text{O}(g) \rightarrow \text{CH}_3\text{CH}_2\text{OH}(g) + 3\text{O}_2(g)$ $\Delta H = +1279 \text{ kJ mol}^{-1}$ (By changing the direction of the equation, we change the sign of $\Delta H$ .) <p>Adding these equations together, we obtain:</p> $\text{CH}_3\text{CH}_2\text{OH}(l) \rightarrow \text{CH}_3\text{CH}_2\text{OH}(g)$ $\Delta H = 44 \text{ kJ mol}^{-1}$ <p><i>Note: Students are not required to calculate the value of <math>\Delta H_{\text{vap}}</math>. The actual value is <math>+42.3 \text{ kJ mol}^{-1}</math>. This discrepancy can be explained by the fact that the bond enthalpies used are always average bond enthalpies.</i></p>	<p>CH11/12–6, 7 <span style="float: right;">Band 6</span></p> <ul style="list-style-type: none"> <li>• Identifies the difference as <math>\Delta H_{\text{vap}}</math> ethanol. <span style="float: right;">2</span></li> </ul> <p>AND</p> <hr/> <ul style="list-style-type: none"> <li>• Gives ONE reason. <span style="float: right;">2</span></li> </ul> <hr/> <ul style="list-style-type: none"> <li>• Any ONE of the above points. <span style="float: right;">1</span></li> </ul>

**Question 8** (3 marks)

There is a use for the equilibrium constant in exploring the dissociation of acids and bases. It is frequently called the acid-dissociation equilibrium constant and given the symbol  $K_a$ . The table below shows some details of ethanoic acid and nitric acid.

Name	Formula	$K_{eq}(K_a)$
ethanoic acid	CH <sub>3</sub> COOH	$1.8 \times 10^{-5}$
nitric acid	HNO <sub>3</sub>	40

- a. Write an expression for the equilibrium constant for hydrochloric acid, showing the species present. 1 mark

---

---

---

- b. What does the size of the equilibrium constants tell us about the relative number of hydrogen ions that would be present in equimolar solutions of the two acids? 2 marks

---

---

---

---

**Question 9** (3 marks)

A group of students was investigating the solubility of silver chloride (AgCl) in water at 25°C. Their results indicated that it was  $1.51 \times 10^{-5} \text{ mol L}^{-1}$ .

- a. Calculate the solubility product ( $K_{sp}$ ) for silver chloride using this data. 2 marks

---

---

---

---

- b. Compare this figure with the accepted value. 1 mark

---

---

## PART B (continued)

Sample answer			Syllabus outcomes, targeted performance bands and marking guide
<b>Question 8</b>			CH12–6, 14 Bands 3–6
Compound	Structural formula	Justification	<ul style="list-style-type: none"> <li>Draws structural formula for each compound.</li> </ul> AND <ul style="list-style-type: none"> <li>Provides justification for each compound. 5</li> <li>Correctly draws, with relevant justification, some structural formula. 3–4</li> <li>Correctly identifies some chemical characteristics of some compounds. 2</li> <li>Provides some relevant information. 1</li> </ul>
compound A $C_4H_8$	<pre>       H             H-C-H             H       H                 H-C-C=C                   H   H   H           </pre>	Compound A produces 2-methylpropane when undergoing an addition reaction with hydrogen. This identifies compound A as 2-methylpropene.	
compound B $C_4H_8Br_2$	<pre>       H             H-C-H             H       H                 H-C-C-C-H                   H  Br Br           </pre>	Compound B must be 1,2-dibromo-2-methylpropane formed from the addition of bromine to 2-methylpropene.	
compound C $C_4H_9OH$	<pre>       H             H-C-H             H       H                 H-C-C-C-H                   H  OH  H           </pre> 2-methylpropan-2-ol	Compound C is 2-methylpropan-2-ol (or 2-methyl-2-propanol), a tertiary alcohol formed when water is added to 2-methylpropene.	
compound D $C_4H_9OH$	<pre>       H             H-C-H             H       H                 H-C-C-C-H                   H  H  OH           </pre> 2-methylpropan-1-ol	Compound D is 2-methylpropan-1-ol (or 2-methyl-1-propanol), a primary alcohol formed when water is added to 2-methylpropene.
